

- **Capacity Analysis Results:** The initial Capacity Analysis for MAH was conducted by gathering data across CONUS. These results are summarized on the following tables. The Capacity Analysis Report includes data which compare the total space currently on an installation or occupied by the Activity against what is required at an average space requirement of 200 GSF per person, used as a means to estimate the shortfall or excess of space which may currently exist, after accounting for surge requirements.

The scope of work undertaken by the HSA JCSG was generally limited to headquarters and administration facilities located within 100 miles of the Pentagon, unless otherwise specifically defined. As such, the subsequent round of analysis of ATEC's facilities was limited to its HQ facility, as shown on the Table 3 at the end of this section. Table 3 was used to identify facilities for specific review and to accumulate capacity and other data for use in subsequent analysis tasks. It was determined that Lorton warehouse facility should be excluded from the analysis, leaving only the headquarters space at Park Center IV in the scenario, as illustrated in Table 4 on the last page.
